

Transforming VISION into INNOVATION

We drive technical progress with creative ideas! Together we develop your project from vision to market launch – to gain you a lead through innovation.

WE ARE YOUR NITINOL EXPERTS!

Whether it's a new development or the next generation of your medical device, our team of materials specialists, development engineers, mechatronics engineers and quality managers will be at your side at each stage of the development process, right up to market approval.

The possibilities offered by Nitinol are virtually inexhaustible. Therefore, our focus in the first phase of the project is on understanding each other's ideas. We want to understand the application of your medical device in detail to be able to provide you with the best possible match between technology, benefits, and user-friendliness. Subsequent rapid prototyping is, of course, part of the development process.

Nowadays, economic efficiency plays the all-important role in transferring a development into mass production. The manufacturing processes are adjusted to the optimal cost-benefit ratio already in the development phase and the tools and fixtures are designed for series production – all under the watchful eyes of our quality managers.
